Research Interests

My research aims to democratize online community governance. I approach this problem in two ways. First, I conduct computational social science research to build models of longitudinal community dynamics. In this work, I develop natural language processing-based approaches to measuring social phenomena. Second, I build new tools to help online community moderators guide and adapt to the norms of the groups they run. I adopt qualitative, user-centered design approaches to inform early prototypes, and larger scale quantitative analyses to evaluate impact.
